

Cart Design Development: Low Fidelity to High Fidelity

In my initial design, I had a cart modal pop out from the right side of the browser. However, I realized through general user testing that the modal became distracting and laid on top of important information. Through this process, I decided that I would create a separate cart page. My initial sketch of the cart page takes elements of the cart module and translate that to a page format.

For my high-fidelity prototype, I had added the ability to remove an item. Additionally, I changed the size of the costs to help with the visual hierarchy for the user to easily see the important information of the cart.
